For values of *n* and *p* not tabulated here adequate approximations to required probabilities may be obtained as follows:-

- (i) Use the Poisson approximation with $\lambda = np$ for large *n* and $p < 0.1$
- (ii) Use the Normal approximation with $\mu = np$, $\sigma = \sqrt{[np(1-p)]}$, if $0.1 \leq p \leq 0.9$ and

$$n \geq \max \left[\frac{9(1-p)}{p}, \frac{9p}{1-p} \right]$$

When λ exceeds 20, approximate probabilities may be obtained by use of the *Normal Distribution*, with mean λ and standard deviation $\sqrt{\lambda}$. This approximation, though usually satisfactory for most practical purposes, can lead to considerable errors when probabilities are calculated in the tails of the distribution.

Table 4 AREAS OF THE STANDARDISED NORMAL DISTRIBUTION

The function tabulated is $\frac{1}{\sqrt{2\pi}} \int_u^{\infty} e^{-x^2/2} dx$,

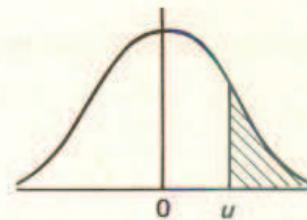

the probability that $U > u$, where $U \sim N(0,1)$.

Table 8 Percentage Points of the χ^2 Distribution

For $v > 30$ take $\chi_v^2(\alpha) = v \left[1 - \frac{2}{9v} + u_\alpha \sqrt{\frac{2}{9v}} \right]^3$ where u_α is such that $\Pr(U > u_\alpha) = \alpha$, and $U \sim N(0,1)$.
